1 FFT ALGORITHM

CooleyTukey FFT algorithm divides a DFT of size N into two interleaved DFTs of size N/2 with each recursive stage producing an overall runtime of $O(N \log(N))$.

Fourier transform of $(x = x_0, x_1, x_2, x_3, \dots, x_n)$ is,

$$X_k = \sum_{i=0}^{N-1} x_i e^{-\frac{j2\pi}{N} ik} \quad (1.0.1)$$

We first compute the DFTs of the even-indexed inputs ($x_{2m} = x_0, x_2, \dots, x_{N-2}$) and of the odd-indexed inputs ($x_{2m+1} = x_1, x_3, \dots, x_{N-1}$), and then combines those two results to produce the DFT of the whole sequence.

$$X_k = \sum_{m=0}^{\frac{N}{2}-1} x_{2m} e^{-\frac{j2\pi}{N} 2mk} + \sum_{m=0}^{\frac{N}{2}-1} x_{2m+1} e^{-\frac{j2\pi}{N} (2m+1)k} \quad (1.0.2)$$

$$X_k = \sum_{m=0}^{\frac{N}{2}-1} x_{2m} e^{-\frac{j2\pi}{N} 2mk} + \sum_{m=0}^{\frac{N}{2}-1} x_{2m+1} e^{-\frac{j2\pi}{N} 2mk} e^{-\frac{j2\pi}{N} k} \quad (1.0.3)$$

$$X_k = \sum_{m=0}^{\frac{N}{2}-1} x_{2m} e^{-\frac{j2\pi}{N} mk} + \left(e^{-\frac{j2\pi}{N} k} \right) \sum_{m=0}^{\frac{N}{2}-1} x_{2m+1} e^{-\frac{j2\pi}{N} mk} \quad (1.0.4)$$

where,

$\sum_{m=0}^{\frac{N}{2}-1} x_{2m} e^{-\frac{j2\pi}{N} mk}$ is the fourier transform of $(x_{2m} = x_0, x_2, \dots, x_{N-2})$ denoted by E_k .

$\sum_{m=0}^{\frac{N}{2}-1} x_{2m+1} e^{-\frac{j2\pi}{N} mk}$ is the fourier transform of $(x_{2m+1} = x_1, x_3, \dots, x_{N-1})$ denoted by O_k .

$$\Rightarrow X_k = E_k + \left(e^{-\frac{j2\pi}{N} k} \right) O_k \quad (1.0.5)$$

Due to the periodicity of the complex exponential,

$$X_{k+\frac{N}{2}} = \sum_{m=0}^{\frac{N}{2}-1} x_{2m} e^{-\frac{j2\pi}{N} 2m(k+\frac{N}{2})} + \sum_{m=0}^{\frac{N}{2}-1} x_{2m+1} e^{-\frac{j2\pi}{N} (2m+1)(k+\frac{N}{2})} \quad (1.0.6)$$

$$X_{k+\frac{N}{2}} = \sum_{m=0}^{\frac{N}{2}-1} x_{2m} e^{-\frac{j2\pi}{N} 2m(k+\frac{N}{2})} + \sum_{m=0}^{\frac{N}{2}-1} x_{2m+1} e^{-\frac{j2\pi}{N} 2m(k+\frac{N}{2})} e^{-\frac{j2\pi}{N} (k+\frac{N}{2})} \quad (1.0.7)$$

$$X_{k+\frac{N}{2}} = \sum_{m=0}^{\frac{N}{2}-1} x_{2m} e^{-\frac{j2\pi}{N} 2mk} e^{-j2\pi m} + \sum_{m=0}^{\frac{N}{2}-1} x_{2m+1} e^{-\frac{j2\pi}{N} 2mk} e^{-j2\pi m} e^{-\frac{j2\pi}{N} k} e^{-j\pi} \quad (1.0.8)$$

$$X_{k+\frac{N}{2}} = \sum_{m=0}^{\frac{N}{2}-1} x_{2m} e^{-\frac{j2\pi}{N} 2mk} + \sum_{m=0}^{\frac{N}{2}-1} x_{2m+1} e^{-\frac{j2\pi}{N} 2mk} e^{-\frac{j2\pi}{N} k} \times -1 \quad (1.0.9)$$

$$X_{k+\frac{N}{2}} = \sum_{m=0}^{\frac{N}{2}-1} x_{2m} e^{-\frac{j2\pi}{N} mk} - \left(e^{-\frac{j2\pi}{N} k} \right) \sum_{m=0}^{\frac{N}{2}-1} x_{2m+1} e^{-\frac{j2\pi}{N} mk} \quad (1.0.10)$$

$$\Rightarrow X_{k+\frac{N}{2}} = E_k - \left(e^{-\frac{j2\pi}{N} k} \right) O_k \quad (1.0.11)$$

This way fourier transform is computed by two sub fourier transforms, and these sub fourier transforms are calculated using the recursive calls.

This algorithm is only valid when the size of the input is a power of 2, so we make the size of the input to its nearest power of 2 by padding zeroes to it.

2 IFFT ALGORITHM

Similar to the FFT algorithm CooleyTukey IFFT algorithm divides a IDFT of size N into two interleaved IDFTs of size N/2 with each recursive

stage producing an overall runtime of $\mathbf{O}(N \log(N))$.

Inverse fourier transform of
($X = X_0, X_1, X_2, X_3, \dots, X_n$) is,

$$x_k = \frac{1}{N} \sum_{i=0}^{N-1} X_i e^{\frac{j2\pi}{N} ik} \quad (2.0.1)$$

We first compute the IDFTs of the even-indexed inputs ($X_{2m} = X_0, X_2, \dots, X_{N-2}$) and of the odd-indexed inputs ($X_{2m+1} = X_1, X_3, \dots, X_{N-1}$), and then combines those two results to produce the IDFT of the whole sequence.

$$x_k = \frac{1}{N} \left(\sum_{m=0}^{\frac{N}{2}-1} X_{2m} e^{\frac{j2\pi}{N} 2mk} + \sum_{m=0}^{\frac{N}{2}-1} X_{2m+1} e^{\frac{j2\pi}{N} (2m+1)k} \right) \quad (2.0.2)$$

$$x_k = \frac{1}{N} \left(\sum_{m=0}^{\frac{N}{2}-1} X_{2m} e^{\frac{j2\pi}{N} 2mk} + \sum_{m=0}^{\frac{N}{2}-1} X_{2m+1} e^{\frac{j2\pi}{N} 2mk} e^{\frac{j2\pi}{N} k} \right) \quad (2.0.3)$$

$$x_k = \frac{1}{2} \left(\frac{1}{N} \sum_{m=0}^{\frac{N}{2}-1} X_{2m} e^{\frac{j2\pi}{N} mk} + \left(e^{\frac{j2\pi}{N} k} \right) \frac{1}{N} \sum_{m=0}^{\frac{N}{2}-1} X_{2m+1} e^{\frac{j2\pi}{N} mk} \right) \quad (2.0.4)$$

where,

$\frac{1}{N} \sum_{m=0}^{\frac{N}{2}-1} X_{2m} e^{\frac{j2\pi}{N} mk}$ is the inverse fourier transform of ($X_{2m} = X_0, X_2, \dots, X_{N-2}$) denoted by e_k .

$\frac{1}{N} \sum_{m=0}^{\frac{N}{2}-1} X_{2m+1} e^{\frac{j2\pi}{N} mk}$ is the inverse fourier transform of ($X_{2m+1} = X_1, X_3, \dots, X_{N-1}$) denoted by o_k .

$$\Rightarrow x_k = \frac{1}{2} \left(e_k + \left(e^{\frac{j2\pi}{N} k} \right) o_k \right) \quad (2.0.5)$$

Due to the periodocity of the complex exponential,

$$x_{k+\frac{N}{2}} = \frac{1}{N} \left(\sum_{m=0}^{\frac{N}{2}-1} X_{2m} e^{\frac{j2\pi}{N} 2m(k+\frac{N}{2})} + \sum_{m=0}^{\frac{N}{2}-1} X_{2m+1} e^{\frac{j2\pi}{N} (2m+1)(k+\frac{N}{2})} \right) \quad (2.0.6)$$

$$x_{k+\frac{N}{2}} = \frac{1}{N} \left(\sum_{m=0}^{\frac{N}{2}-1} X_{2m} e^{\frac{j2\pi}{N} 2m(k+\frac{N}{2})} + \sum_{m=0}^{\frac{N}{2}-1} X_{2m+1} e^{\frac{j2\pi}{N} 2m(k+\frac{N}{2})} e^{\frac{j2\pi}{N} (k+\frac{N}{2})} \right) \quad (2.0.7)$$

$$x_{k+\frac{N}{2}} = \frac{1}{N} \left(\sum_{m=0}^{\frac{N}{2}-1} X_{2m} e^{\frac{j2\pi}{N} 2mk} e^{j2\pi m} + \sum_{m=0}^{\frac{N}{2}-1} X_{2m+1} e^{\frac{j2\pi}{N} 2mk} e^{j2\pi m} e^{\frac{j2\pi}{N} k} e^{j\pi} \right) \quad (2.0.8)$$

$$x_{k+\frac{N}{2}} = \frac{1}{N} \left(\sum_{m=0}^{\frac{N}{2}-1} X_{2m} e^{\frac{j2\pi}{N} 2mk} + \sum_{m=0}^{\frac{N}{2}-1} X_{2m+1} e^{\frac{j2\pi}{N} 2mk} e^{\frac{j2\pi}{N} k} \times -1 \right) \quad (2.0.9)$$

$$x_{k+\frac{N}{2}} = \frac{1}{N} \left(\sum_{m=0}^{\frac{N}{2}-1} X_{2m} e^{\frac{j2\pi}{N} mk} - \left(e^{\frac{j2\pi}{N} k} \right) \sum_{m=0}^{\frac{N}{2}-1} X_{2m+1} e^{\frac{j2\pi}{N} mk} \right) \quad (2.0.10)$$

$$x_{k+\frac{N}{2}} = \frac{1}{2} \left(\frac{1}{N} \sum_{m=0}^{\frac{N}{2}-1} X_{2m} e^{\frac{j2\pi}{N} mk} - \left(e^{\frac{j2\pi}{N} k} \right) \frac{1}{N} \sum_{m=0}^{\frac{N}{2}-1} X_{2m+1} e^{\frac{j2\pi}{N} mk} \right) \quad (2.0.11)$$

$$\Rightarrow x_{k+\frac{N}{2}} = e_k - \left(e^{\frac{j2\pi}{N} k} \right) o_k \quad (2.0.12)$$

This way inverse fourier transform is computed by two sub inverse fourier transforms, and these sub inverse fourier transforms are calculated using the recursive calls.

Code for both fft and ifft algorithms is

codes/ee18btech11037-fft.py

The algorithm is verified by the below problem.

3 PROBLEM

The command

```
output_signal = signal.lfilter(b,a,
                                output_signal)
```

in Problem 2.3 is executed through following difference equation

$$\sum_{m=0}^M a(m) y(n-m) = \sum_{k=0}^N b(k) x(n-k) \quad (3.0.1)$$

where input signal is $x(n)$ and output signal is $y(n)$ with initial values all 0. Replace **signal.filtfilt** with your own routine and verify

4 SOLUTION

Let $X(z)$ and $Y(z)$ be the respective z-transforms of $x(n)$ and $y(n)$ respectively. Using the properties of z-transform

$$\mathcal{Z}\{x(n-k)\} = z^{-k}X(z) \quad (4.0.1)$$

$$\mathcal{Z}\{y(n-m)\} = z^{-m}Y(z) \quad (4.0.2)$$

Applying z-transform to the both sides of the difference equation

$$Y(z) \left(\sum_{m=0}^M a(m) z^{-m} \right) = X(z) \left(\sum_{k=0}^N b(k) z^{-k} \right) \quad (4.0.3)$$

$$H(z) = \frac{Y(z)}{X(z)} = \frac{\sum_{k=0}^N b(k) z^{-k}}{\sum_{m=0}^M a(m) z^{-m}} \quad (4.0.4)$$

$H(K)$ is evaluated from (4.0.4) using the coefficients b, a .

$X(z)$ is evaluated by the above mentioned fft algorithm.

$Y(z)$ is evaluated by multiplying $X(z)$ and $H(z)$.

$$Y(K) = H(K) X(K) \quad (4.0.5)$$

$y(n)$ is evaluated by the above mentioned ifft algorithm

The python code used to obtain the output signal and draw the plots is

```
codes/ee18btech11037.py
```

Below is the soundfile constructed from output signal y using own routine filter

```
codes/Sound_With_ReducedNoise_ownroutine.
wav
```

5 VERIFICATION

Both the output signals obtained using builtin `signal.filtfilt` command and own routine method sounds the same.

Plotting the time domain output signal evaluated from both own routine filter and `signal.filtfilt` command

Fig. 0: Time domain response

Plotting the frequency domain response evaluated from both own routine and `signal.filtfilt`

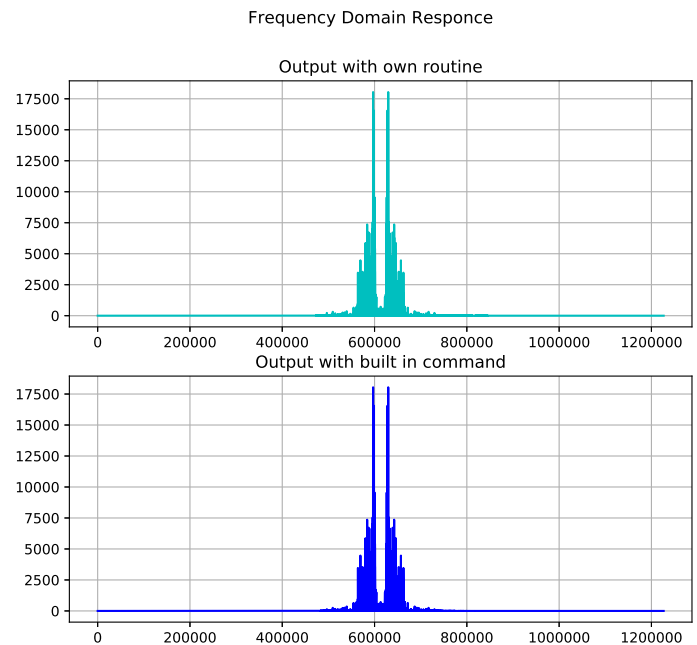

Fig. 0: Frequency domain response
